

# Quick start guide

The Airsense sensor must be paired with your Homebase before use by setting the Homebase and the Airsense into pairing mode at the same time. Please follow these steps to pair your new sensor to the Energomonitor Homebase:

- 1 Set the Homebase into pairing mode by pushing both buttons at the same time. The Homebase will stay in pairing mode for one minute.**
- 2 Take your Airsense canary sensor and temporarily remove the “perch” from the base of the sensor - then touch it to the canary's head  for 2 seconds. A magnet contained in the perch will trigger the sensor to enter pairing mode.**
- 3 The display of the Homebase will show the number “400” to show that pairing was successful. Please, wait for up to 1 minute for both devices to exit pairing mode before use.**

For more information go to <http://support.energomonitor.com>

The sensor is now paired with the Homebase and you can see the CO<sub>2</sub> concentration value that is being monitored by your Airsense on the display of your Homebase.

Now go to the Energomonitor app <http://app.energomonitor.com> and configure your new Airsense sensor.

**Troubleshooting tip:** If you can't see the Airsense sensor in the app, you probably didn't successfully complete the pairing process while the Homebase was in pairing mode. Simply repeat the steps no. 1 and 2 within the one minute pairing window.

Setup should be complete, please enjoy using your new Airsense sensor.
